The FCC restricts and confines communication enough as it stands. To have an "open" backdoor would be a mistake for the FCC and any goverment that supported it.

The age of computers we are curently in is promoting a level of inborn know-how with the generations born into the computer age. The more our homes and lives become attached to computers and the internet connections needed to maintain these services, the less the people running these services will really nkow about them.

Hackers will always find a way to break down, and in some rare cases, abuse "security". If there is a mandatory backdoor for one branch of the goverment to use to "spy", that leaves one easy place for theft and crime.

Please think of the long term applications of new hardware and software as this "security" technology is developed. If this must happen, please restrict the ability to use this to physical locations in place of having the ability to use it remotely. There should also be a review panel that should beable to say NO to any such request.

I also feel it would please the public if the information gathered was approved and focused on very defined items. These items should be as clear as the number of eyes on a human.

Thank You for reading.
